

Overview of Module 5

Hi, welcome to Module 5. In this week you're going to learn how to create data visualization. After learning how to download data, prepare data, and explore data it is time to learn how to present those data to the public and one of the best ways to present data to the public is through graphs, maps, charts, diagrams, interactive graphics etc.. And this is what this module covers.

This week we will begin by learning certain important principles, elementary principles of data visualization and then later on you are going to learn how to use Flourish, a tool to design interactive graphics. Besides all this you can also learn how to sonify your data, how to transform numbers into sounds so visually impaired people can also access the insights and the stories that you want to tell.
